

Hey! What Is That In Your Pocket? The Mobile Device Future

Edward J. DELP
Purdue University, USA

This talk will describe a view of the future using new mobile connected devices. It is obvious that in a very short time your mobile device may be your principle, if not only, way to communicate. I will describe new applications that will include the use of context based information. A simple example of this is geo-location and other information relating to how a user is "using" the mobile device. I will also describe other applications in language translation, health delivery, and the use of on-board sensors.
